1	Introduction	1
1.1	Scope & Research Objectives	1
1.2	Thesis Outline	1
2	Literature Review	2
2.1	Governing Equations & Boundary Conditions	2
2.2	Wake Models	2
2.3	Wake Superposition Methods	2
2.4	Overview	2
2.5	Validation	2
3	Methodology & Data	3
3.1	Research Methodology	4
3.1.1	4
3.1.2	Yaw misalignment	4
3.1.3	Rotor averaged wind speed	4
3.1.4	Quantification system	4
3.2	Radar - BEACon	4
3.2.1	BEACon Measurement Campaign	4
3.2.2	Westermost Rough Offshore Wind Farm	5
3.3	Large Eddy Simulations	6
3.3.1	Input parameters	6
3.3.2	Post-processing	6
3.4	Engineering Models	6
3.4.1	Park model	7
3.4.2	Fuga	12
3.5	Data Selection	13
3.5.1	Cases	13
3.5.2	Wind turbines	14
3.5.3	Data planes	15
3.5.4	Grid spacing and domain	16
3.5.5	Inflow profiles	16
4	Park Model: Sensitivity Study	19
4.1	Influence of superposition method	20
4.2	Influence of correction factor	21
4.3	Influence of wake decay coefficient and spacing	22
4.4	Influence of thrust coefficient	23

4.5	Difference between Park 1 and Park 2	25
4.6	Conclusion	26
5	Results & Discussion	27
5.1	Comparison BEACon & LES Data	27
5.1.1	27
5.1.2	Conclusion	27
5.2	Comparison BEACon & Engineering Models	27
5.2.1	27
5.2.2	Conclusion	27
5.3	Comparison LES & Engineering Models	27
5.3.1	27
5.3.2	Conclusion	27
5.4	Superposition of single LES wakes	27
5.4.1	27
5.4.2	Conclusion	27
5.5	Optimization superposition method	27
5.5.1	27
5.5.2	Conclusion	27
6	Conclusions	28
7	Recommendations & Further Research	29
A	Park model: Flow Charts	31
B	Fuga input	32
C	Wakes	33
C.1	Park	33
C.2	Fuga	33
D	More appendices	34
